Hi, i am new to AI, please introduce yourself in three bullet points, and tell me what you are great at

- I'm **ChatGPT**, an AI assistant created by OpenAI. I can understand natural language, answer questions, explain concepts, help solve problems, and work with both text and images.
- I'm great at **learning and productivity tasks**, such as explaining difficult topics, tutoring, writing and editing emails or documents, brainstorming ideas, summarizing information, coding, debugging, and helping plan projects or trips.
- I'm best used as a **thinking partner**. I can help you compare options, generate creative ideas, analyze information, practice conversations, and adapt my explanations to your level—from complete beginner to expert. If I don't know something or need up-to-date information, I can say so or look up current information when appropriate.

Can you guide me how to use github to store project information to send to a friend/client

Absolutely. GitHub is one of the best ways to share projects with friends, clients, or collaborators. You don't need to be a programmer to use it effectively.

Here's a simple workflow:

1. Create a GitHub account

Go to GitHub and create a free account if you don't already have one.

2. Create a repository

A repository (or "repo") is simply a folder for your project.

Give it a name like:

- `website-redesign`

- `marketing-plan`
- `client-portal`

Choose:

- **Public** if anyone can see it.
- **Private** if only people you invite can access it (recommended for client work).

3. Add your project files

You can upload almost anything:

- PDFs
- Word documents
- Images
- PowerPoint presentations
- Excel spreadsheets
- Source code
- Videos (small ones)
- ZIP files

The easiest way is to drag and drop files into the repository using GitHub's web interface.

4. Create a README

A `README.md` file is the project's homepage. It explains what the project is.

Example:

```
# Client Website Project

## Overview
This repository contains all files related to the website redesign.

## Contents
- Proposal.pdf
- Mockups/
- Images/
- Final Report.pdf

## Status
Version 1.2

## Contact
Muhammad
```

GitHub automatically displays this when someone opens the repository.

5. Organize your folders

A clean structure helps others find things quickly.

```
Project/
│
├── README.md
├── Proposal.pdf
├── Documentation/
│   ├── Requirements.pdf
│   └── Notes.docx
├── Images/
├── SourceCode/
└── Final/
```

6. Share with your friend or client

If the repository is:

- **Public:** send them the repository link.
- **Private:** invite them by their GitHub username or email under **Settings → Collaborators**.

7. Update files over time

Whenever you upload a new version, GitHub keeps a history of changes. This means you can:

- See previous versions.
- Restore older files if needed.
- Track who made changes.

If you're working on software

GitHub becomes even more powerful because it can:

- Track every code change.
- Let multiple people work together.
- Review changes before accepting them.
- Report bugs and feature requests using Issues.

If you're NOT a programmer

Many people use GitHub simply as:

- A secure cloud backup.
- A document-sharing platform.
- A portfolio of work.
- A place to collaborate on reports and documentation.

A good repository might look like this

```
MyProject/
│
├── README.md
├── LICENSE
├── docs/
│   ├── Requirements.pdf
│   ├── Architecture.pdf
│   └── UserGuide.pdf
├── images/
├── source/
├── presentations/
└── releases/
```

A few tips

- Keep filenames clear and consistent (e.g., `ProjectProposal_v2.pdf` instead of `final_final2.pdf`).
- Update the `README.md` whenever the project changes.
- Use folders to group related files.
- Keep private client work in **private repositories**.

If you're completely new to GitHub, I can also ↳ walk you through creating your **first repository from scratch** with screenshots-style explanations, as if we're sitting together.
